Heavy Ion Collisions → access extreme ( $T, \rho$ ) of nuclear system

(Very) low  $\rho$ :

- Correlations are expected to become important
- non-homogeneous nuclear matter
- ↓
- fragmentation

Heavy Ion Collisions → access extreme ( $T, \rho$ ) of nuclear system

(Very) low  $\rho$ :

- Correlations are expected to become important

non-homogeneous nuclear matter

fragmentation

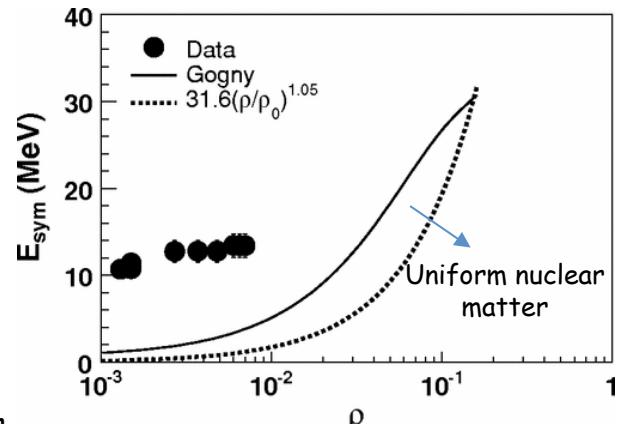

- Even lower  $\rho$  : few body - correlations remain important (system minimizes its  $E$  by forming light clusters)

**Clusters formation**

- Correlations
- In-medium modification of cluster properties
- Mean-field effects

The occurrence of clusters changes  $E_{\text{sym}}$  because cluster correlations depend on  $N/Z$

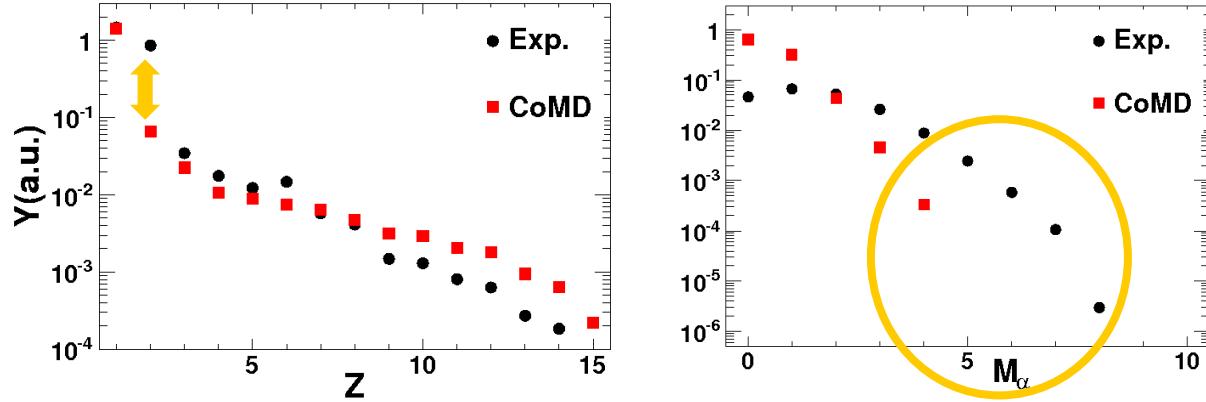

S. Kowalski et al., PRC 75 (2007)  
014601

Do and when bosonic properties dominate over fermionic properties?

# The experiment

Goal: Study the isotopic composition of quasi-projectiles (QP)  
in  $^{40,48}\text{Ca} + ^{40,48}\text{Ca}$  @35MeV/A

VAMOS

Large acceptance  
High resolution

} Projectile-like fragment  
- PLF ( $Z, A, E_k, \vec{p}$ )

INDRA

High granularity  
High E resolution  
 $Z (A)$  identification

} Light Charged Particles  
- LCP ( $Z, A, E_k, \vec{p}$ )

→ Event-by-event reconstruction of the decaying QP

# Event reconstruction and selection

## QP reconstruction :

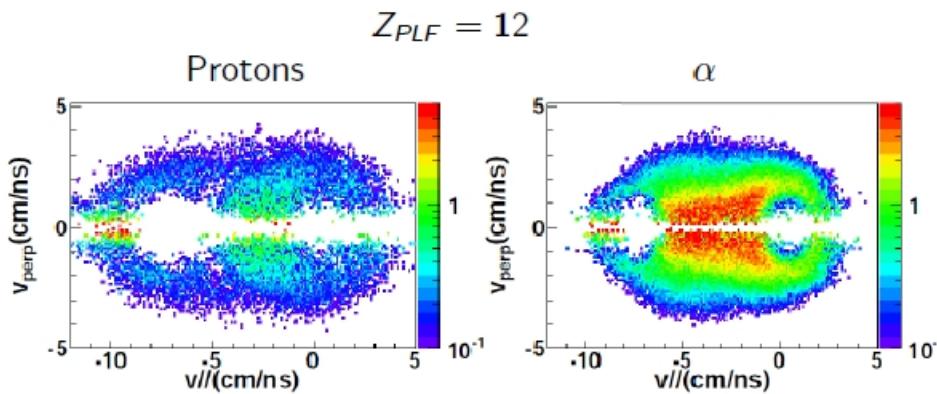

## PLF + CP belonging to QP

(based on  $v/v_{PL,F}$  criteria)

J. Steckmeyer et al., Nucl. Phys. A 686 (2001) 537

$Z_{QP}, A_{QP}, E_{QP}^*$

(from calorimetry)

## QP reconstruction :

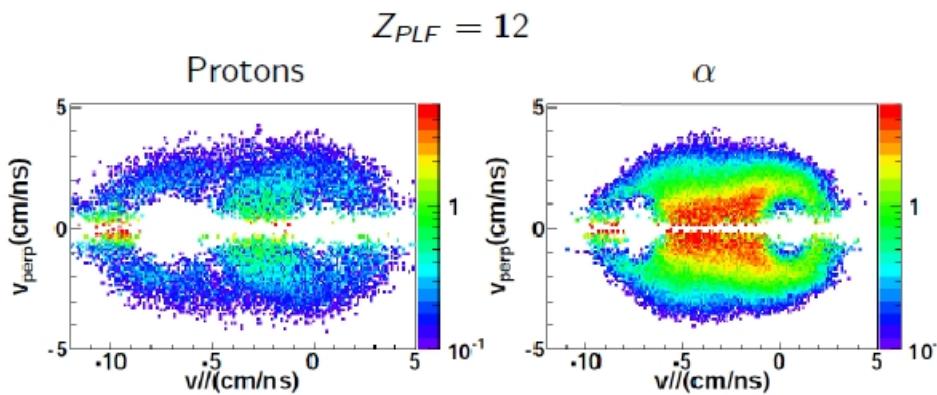

PLF + CP belonging to QP

(based on  $v/v_{PLF}$  criteria)

J. Steckmeyer et al., Nucl. Phys. A 686 (2001) 537

$Z_{QP}, A_{QP}, E_{QP}^*$

(from calorimetry)

## Event selection : $^{34-46}\text{Ca}$ QP events

## Event selection : isotropic emission events

to have a certain degree of equilibration

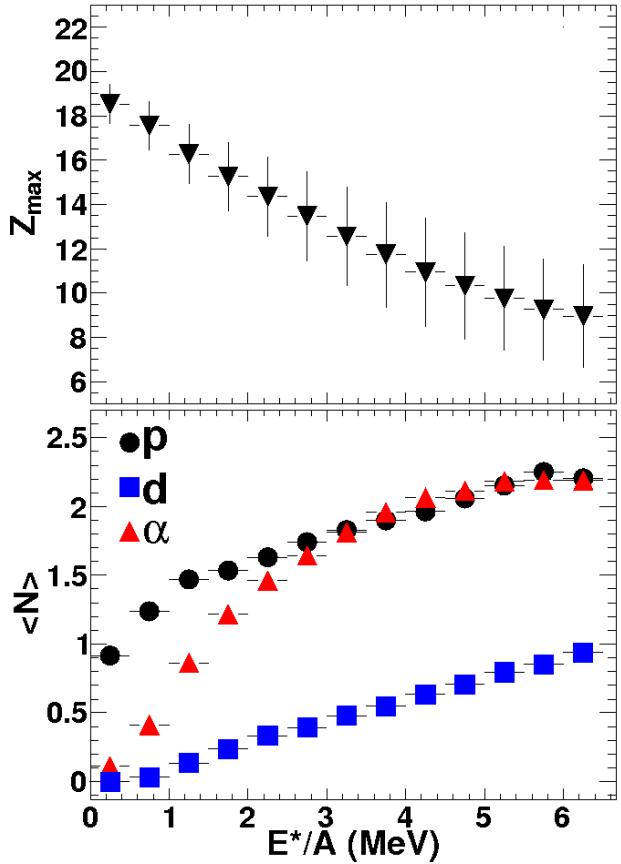

The influence of these selections was monitored all along the analysis

$$Q_{\text{shape}} = \frac{\sum (p_z^i)^2}{\sum (p_{\text{perp}}^i)^2} \quad -0.3 < \log Q_{\text{shape}} < 0.3$$

# Event characteristics

Z of the biggest fragment :

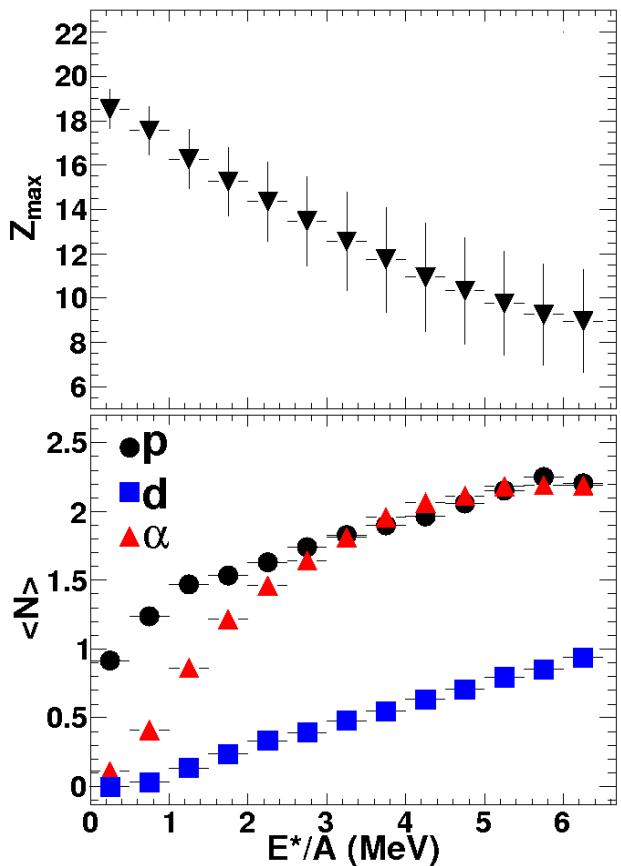

Light charged particle multiplicities :

Similar to previous works

E. Bonnet et al., Nucl. Phys. A 816 (2009) 1 and refs therein

# Event characteristics

Z of the biggest fragment :

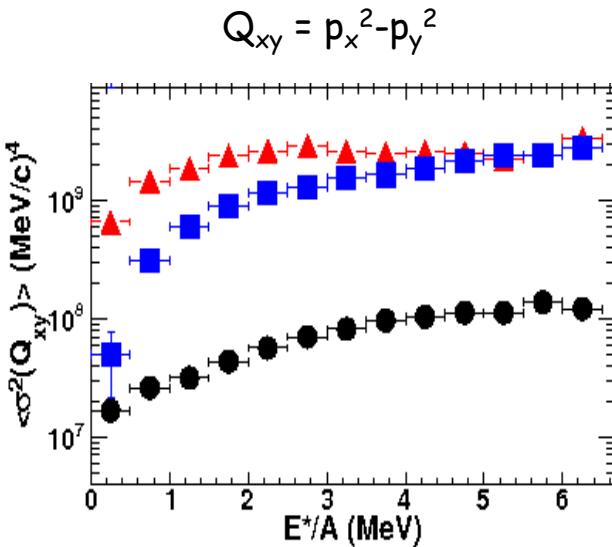

Light charged particle multiplicities :

Similar to previous works

E. Bonnet et al., Nucl. Phys. A 816 (2009) 1 and refs therein

Quadrupole momentum fluctuations :

Within a classical picture:

different QP T at the emission of each particle-type

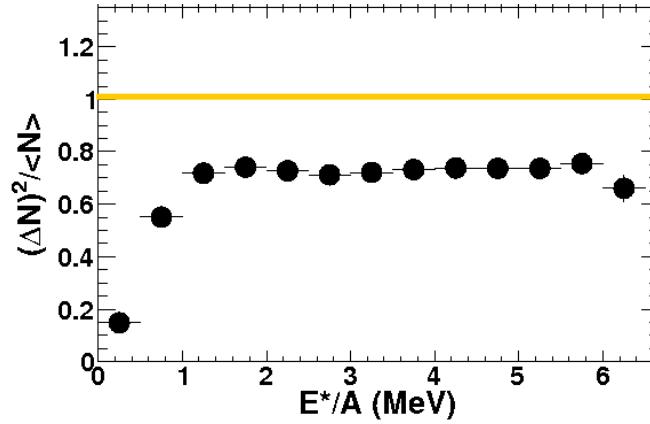

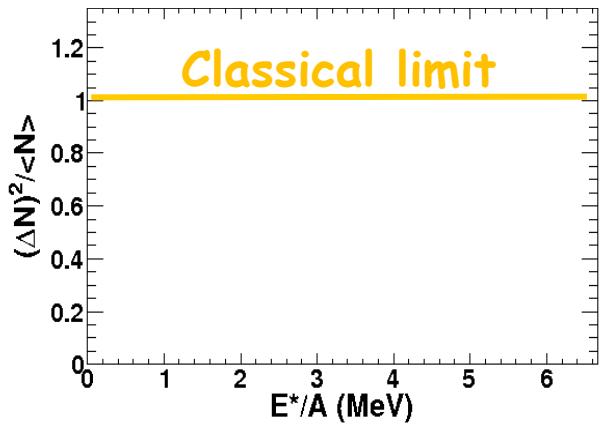

S. Wuenschel et al.,  
Nucl. Phys. A 843 (2010) 1

different time scale of different particle-type emission

G. Verde et al., EPJA 30 (2006) 81  
R. Ghetti et al., PRL 91 (2003)  
092701

# Particle multiplicity fluctuations

Fermions

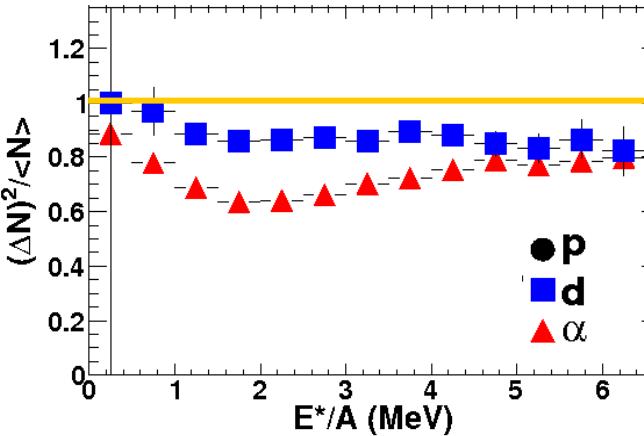

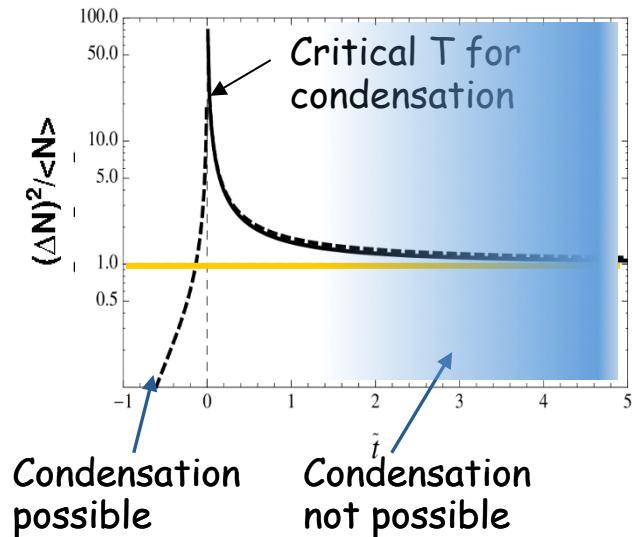

# Particle multiplicity fluctuations

## Fermions

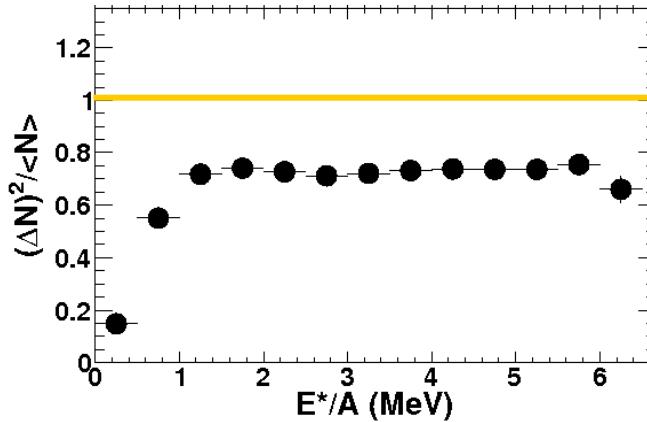

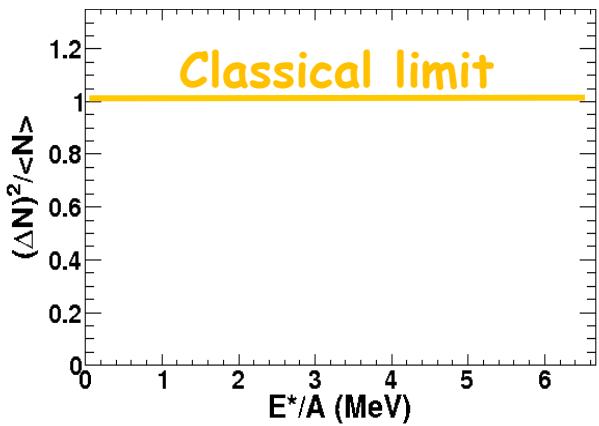

## Bosons

# Particle multiplicity fluctuations

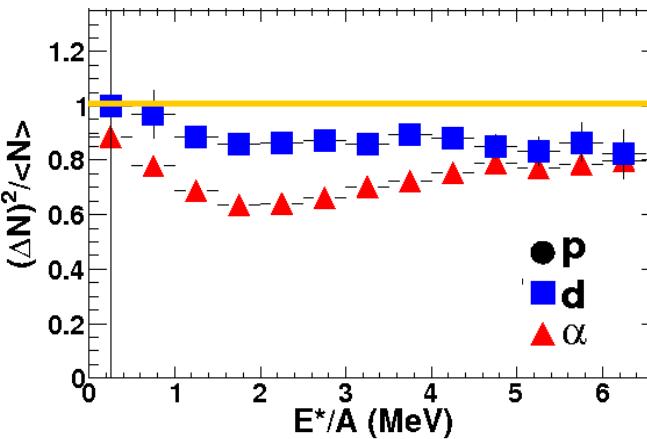

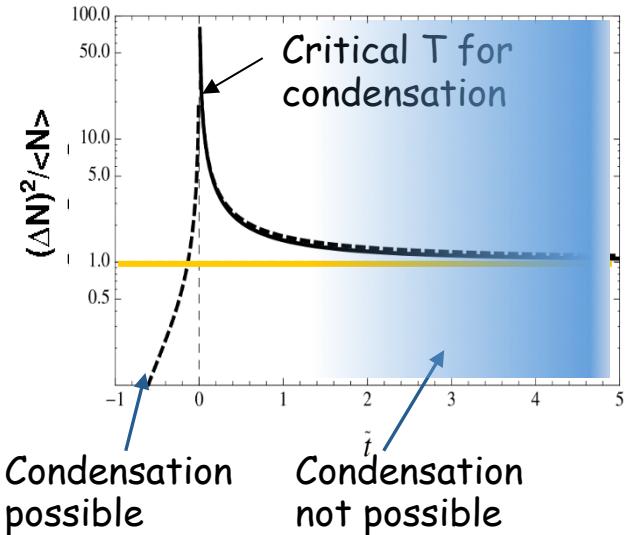

## Fermions

- ✓ The quantum nature of p, d,  $\alpha$  **MUST** be accounted for

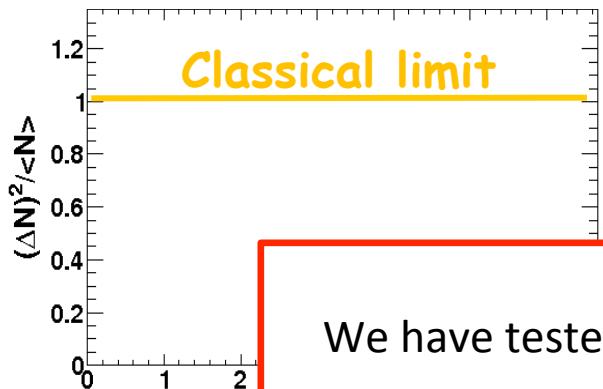

## Bosons

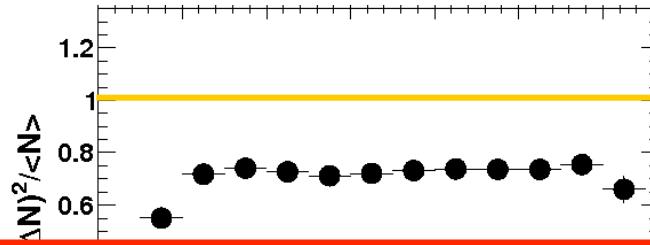

- ✓ Bosons experience conditions compatible with a possible condensation

# Particle multiplicity fluctuations

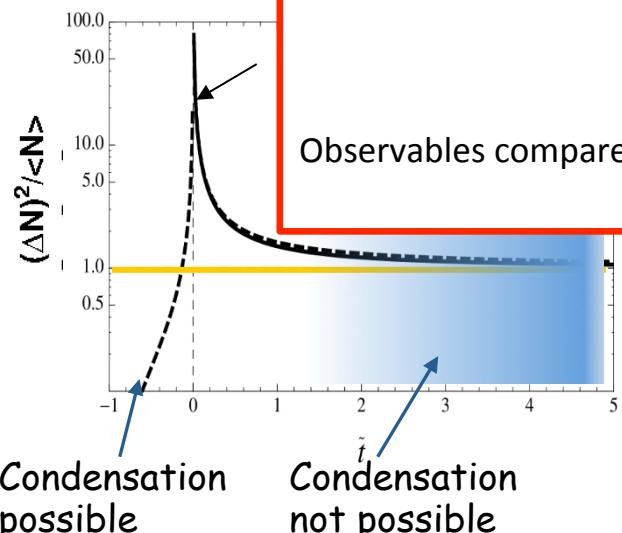

## Fermions

We have tested that:

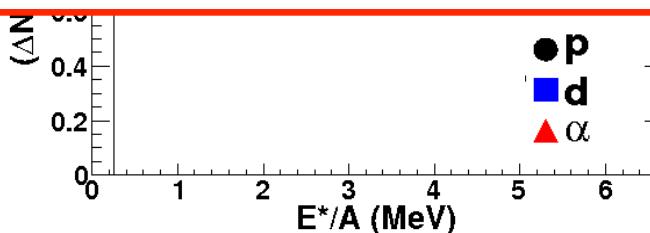

The quantum nature of p, d, **MUST** be accounted for

Observables compared to GEMINI predictions(however dynamics is missing)

the observed trends are **NOT compatible** with a standard

statistical emission

mesons experience conditions comparable with a possible condensation

Ideally: selection of  $\alpha$ -conjugate  
and  $d$ -conjugate QP       $\longrightarrow$        $A_{QP} = 40$  events

- Mixing events with different number of bosons may wash out BEC signals
- Need statistics

$A_{QP} = 36, 40, 44$  for  $\alpha$ -based analysis

$34 \leq A_{QP} \leq 46$       for  $d$ -based analysis

$38 \leq A_{QP} \leq 42$       for  $p$ -based analysis

Results consistent to those obtained with  
 $A_{QP} = 40$  events within the error bars

**Method:** quantum fluctuation analysis technique

H. Zheng et al., Nucl. Phys. A 892 (2012) 43; PLB 696 (2011) 178;  
PRC 86 (2012) 027602

**Ingredients :**

- Fermions follow the Fermi statistics and bosons the Bose statistics
- Coulomb repulsion is accounted for
- dilute system

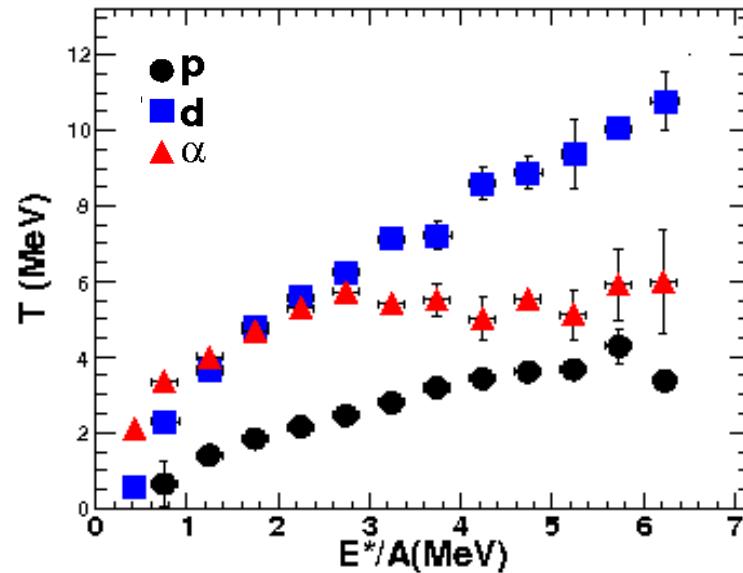

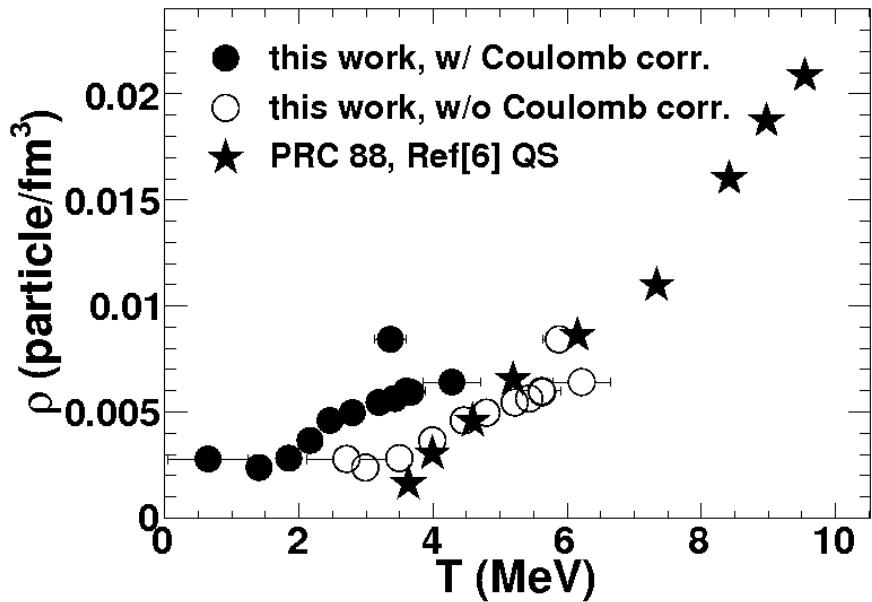

$$\longrightarrow \left\{ \begin{array}{l} \langle N \rangle_i = f_1(T_i, \rho_i, \mu_i) \\ (\Delta N_i)^2 / \langle N \rangle_i = f_2(T_i, \rho_i, \mu_i) \\ \sigma^2(Q_{xy})_i = f_3(T_i, \rho_i, \mu_i) \end{array} \right. \quad \rightarrow \quad \boxed{(T_i, \rho_i) \text{ for each particle species } i \text{ from experimental data}}$$

T : temperature

$\rho$  : mean partial density

$\mu$  : chemical potential

# Temperature vs density and $E^*$

-  $(T,\rho)_p$  agreement with  $(T,\rho)$  from coalescence approach in a quantum-statistical framework including medium effects for similar experimental conditions

S. Kowalski et al. PRC 75 (2007)  
014601;

L. Qin et al., PRL 108 (2012) 172701;

G. Ropke et al., PRC 88 (2013)  
024609

H. Zheng et al., J of Phys G 41 (2014)  
055109

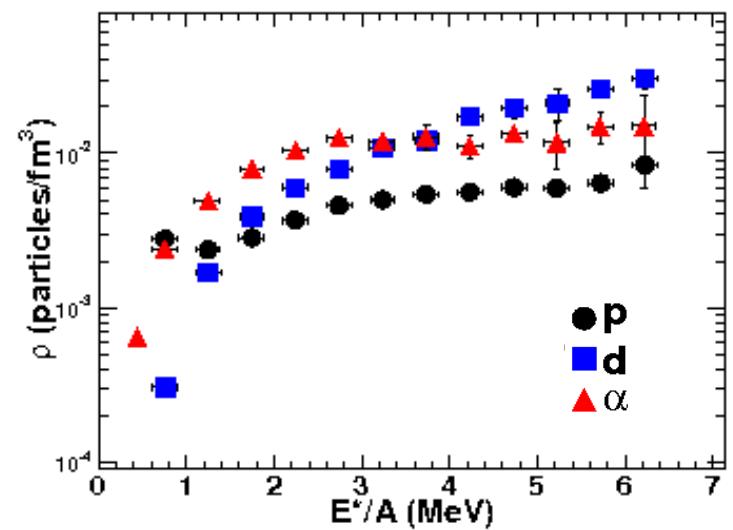

Spread in  $T$ : different ordering in emission time observed via particle interferometry (classical picture)

In agreement with previous works

G. Verde et al., EPJA 30 (2006) 81  
R. Ghetti et al., PRL 91 (2003)  
092701

D. Gourio et al., EPJA 7 (2000) 245

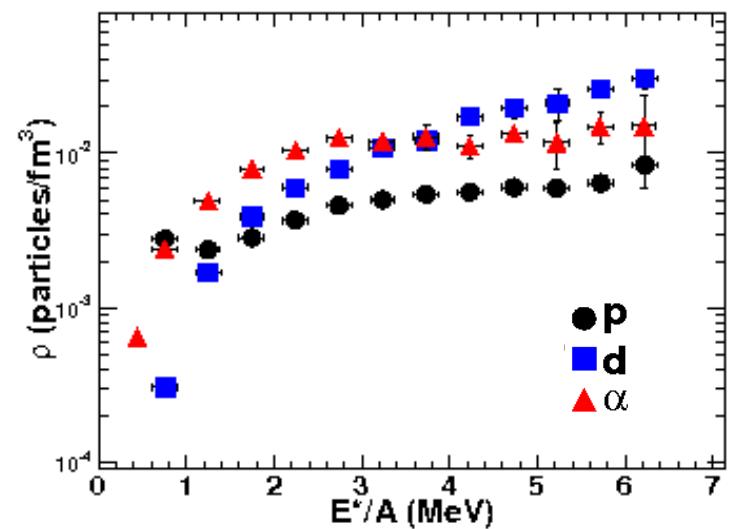

# Density vs $E^*$

✓  $\rho$  increases as  $E^*$  increases :

- $E^* < 2-3$  MeV : emission from the surface  
( $\rho_{\text{surface}} < \rho_{\text{bulk}}$ )
- $E^* > 3$  MeV bulk multifragmentation  
(coexistence of LP and fragments)

# Density vs $E^*$

✓  $\rho$  increases as  $E^*$  increases :

- $E^* < 2-3$  MeV : emission from the surface ( $\rho_{\text{surface}} < \rho_{\text{bulk}}$ )
- $E^* > 3$  MeV bulk multifragmentation (coexistence of LP and fragments)

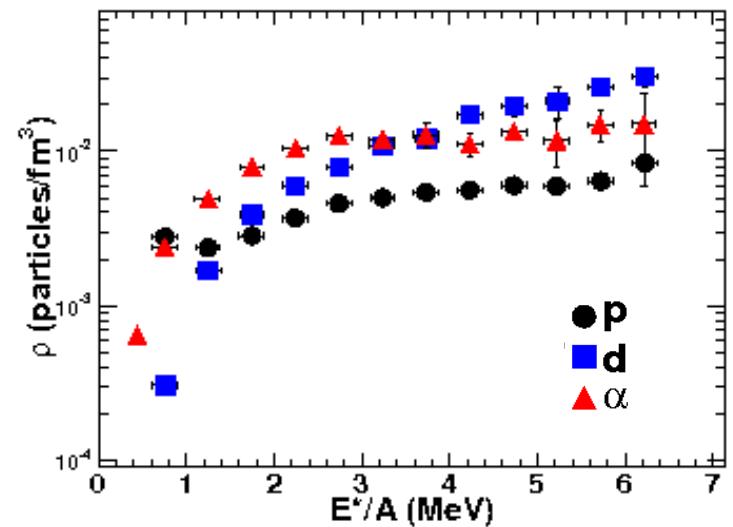

✓  $\rho_{\text{fermions}} < \rho_{\text{bosons}}$  up to 4 times ( $E^* > 1$  MeV)

$$\downarrow \quad v_i = \langle N \rangle_i / \rho \quad R_i^3$$

Mean distance  
between fermions

60% higher than mean distance  
between bosons

# Density vs $E^*$

✓  $\rho$  increases as  $E^*$  increases :

- $E^* < 2-3$  MeV : emission from the surface ( $\rho_{\text{surface}} < \rho_{\text{bulk}}$ )
- $E^* > 3$  MeV bulk multifragmentation (coexistence of LP and fragments)

✓  $\rho_{\text{fermions}} < \rho_{\text{bosons}}$  up to 4 times ( $E^* > 1$  MeV)

$$\downarrow \quad v_i = \langle N \rangle_i / \rho \quad R_i^3$$

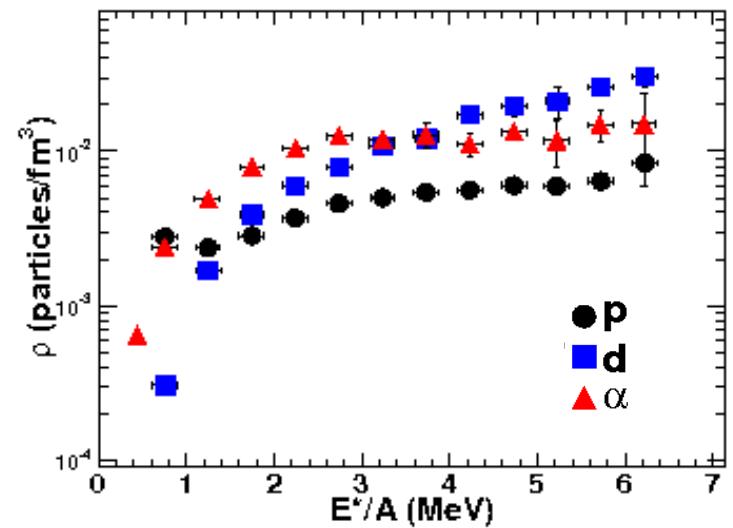

Mean distance  
between fermions

60% higher than mean distance  
between bosons

## Interpretation :

- Reduction of fermionic component where the bosonic one is present
- Appearance of BEC?
  - $\varepsilon_{\text{bosons}} > \varepsilon_{\text{fermions}}$
  - $T_C \sim$  few MeV
  - ...

# Density vs $E^*$

✓  $\rho$  increases as  $E^*$  increases :

- $E^* < 2-3$  MeV : emission from the surface ( $\rho_{\text{surface}} < \rho_{\text{bulk}}$ )

- $E^* > 3$  MeV bulk multifragmentation (coexistence of LP and fragments)

✓  $\rho_{\text{fermions}} < \rho_{\text{bosons}}$  up to 4 times ( $E^* > 1$  MeV)

$$\downarrow \quad v_i = \langle N \rangle_i / \rho \quad R_i^3$$

Mean distance  
between fermions

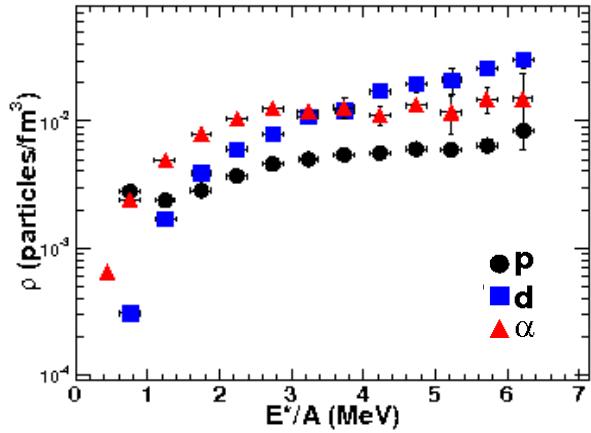

60% higher than mean distance  
between bosons

These events are a mixture of bosons and fermions

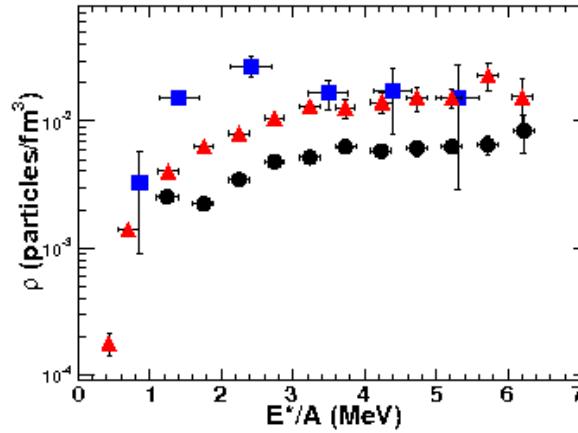

# Density vs $E^*$ for "purely" $\alpha(d,p)$ -like events

Selection of events dominated by emission of bosons or fermions : "pure" events

Mixture

Pure

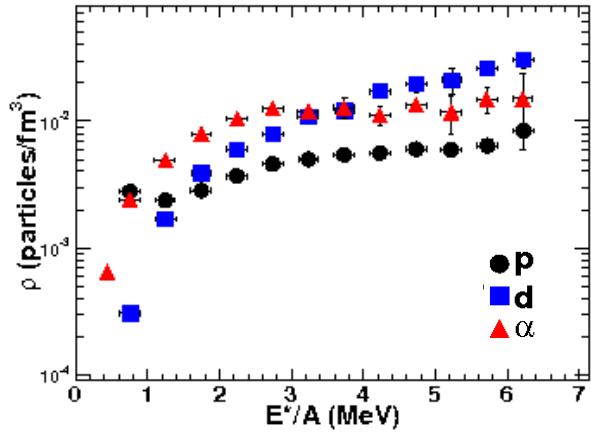

- ✓  $\rho_{\alpha \text{ pure}} = \rho_{d \text{ pure}}$  ( $E^* > 2 \text{ MeV}$ )
- ✓  $\rho_{\text{fermions pure}} < \rho_{\text{bosons pure}}$

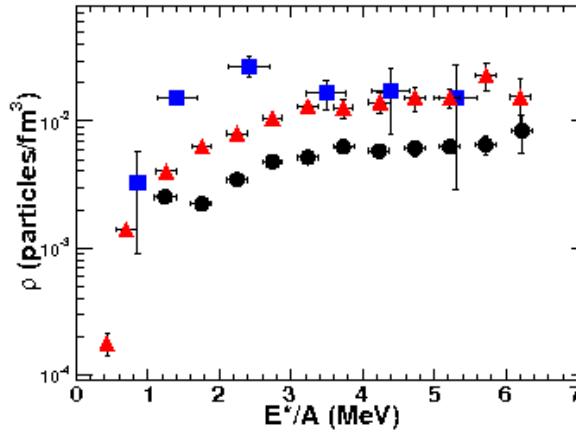

# Density vs $E^*$ for "purely" $\alpha(d,p)$ -like events

Selection of events dominated by emission of bosons or fermions : "pure" events

Mixture

Pure

✓  $\rho_{i \text{ pure}} = \rho_{i \text{ mixture}}$

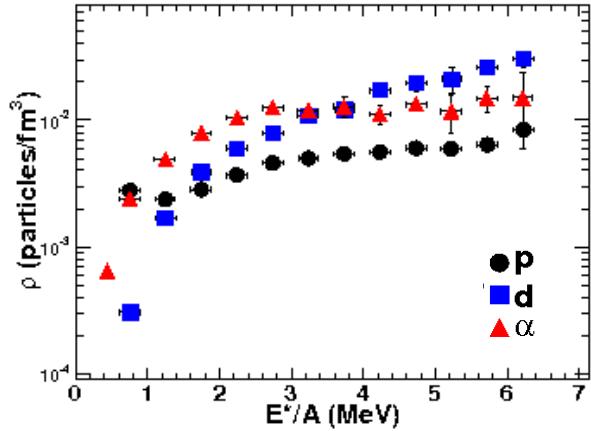

✓  $\rho_{\alpha \text{ pure}} = \rho_{d \text{ pure}} \quad (E^* > 2 \text{ MeV})$

✓  $\rho_{\text{fermions pure}} < \rho_{\text{bosons pure}}$

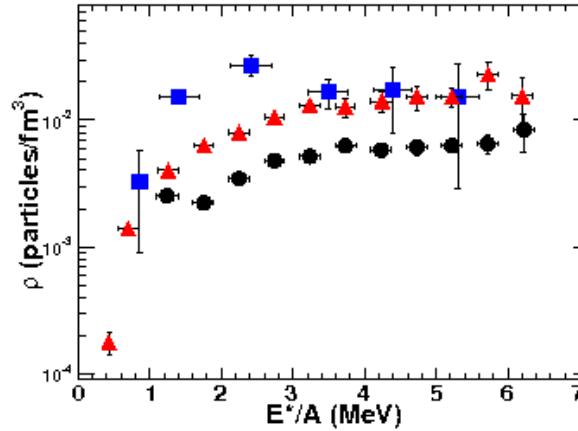

# Density vs $E^*$ for "purely" $\alpha(d,p)$ -like events

Selection of events dominated by emission of bosons or fermions : "pure" events

Mixture

Pure

✓  $\rho_{i \text{ pure}} = \rho_{i \text{ mixture}}$

✓  $\rho_{\alpha \text{ pure}} = \rho_{d \text{ pure}} \quad (E^* > 2 \text{ MeV})$

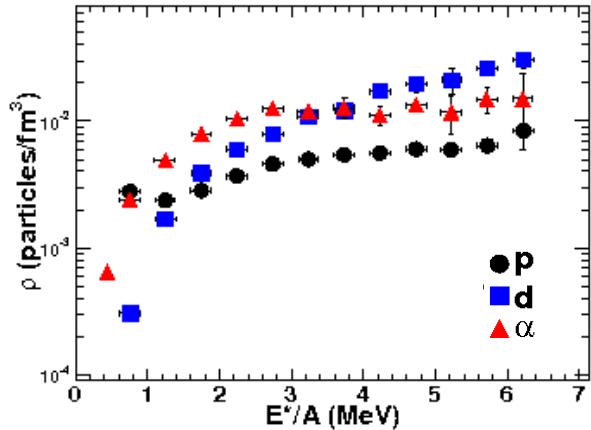

✓  $\rho_{\text{fermions pure}} < \rho_{\text{bosons pure}}$

$\rho_{\text{fermions}} < \rho_{\text{bosons}}$  independently of the presence of fermions in the event

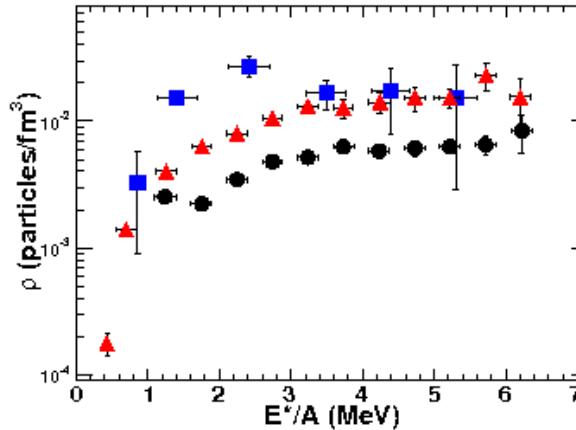

# Density vs $E^*$ for "purely" $\alpha(d,p)$ -like events

Selection of events dominated by emission of bosons or fermions : "pure" events

Mixture

Pure

✓  $\rho_{i \text{ pure}} = \rho_{i \text{ mixture}}$

✓  $\rho_{\alpha \text{ pure}} = \rho_{d \text{ pure}} \quad (E^* > 2 \text{ MeV})$

✓  $\rho_{\text{fermions pure}} < \rho_{\text{bosons pure}}$

$\rho_{\text{fermions}} < \rho_{\text{bosons}}$  independently of the presence of fermions in the event

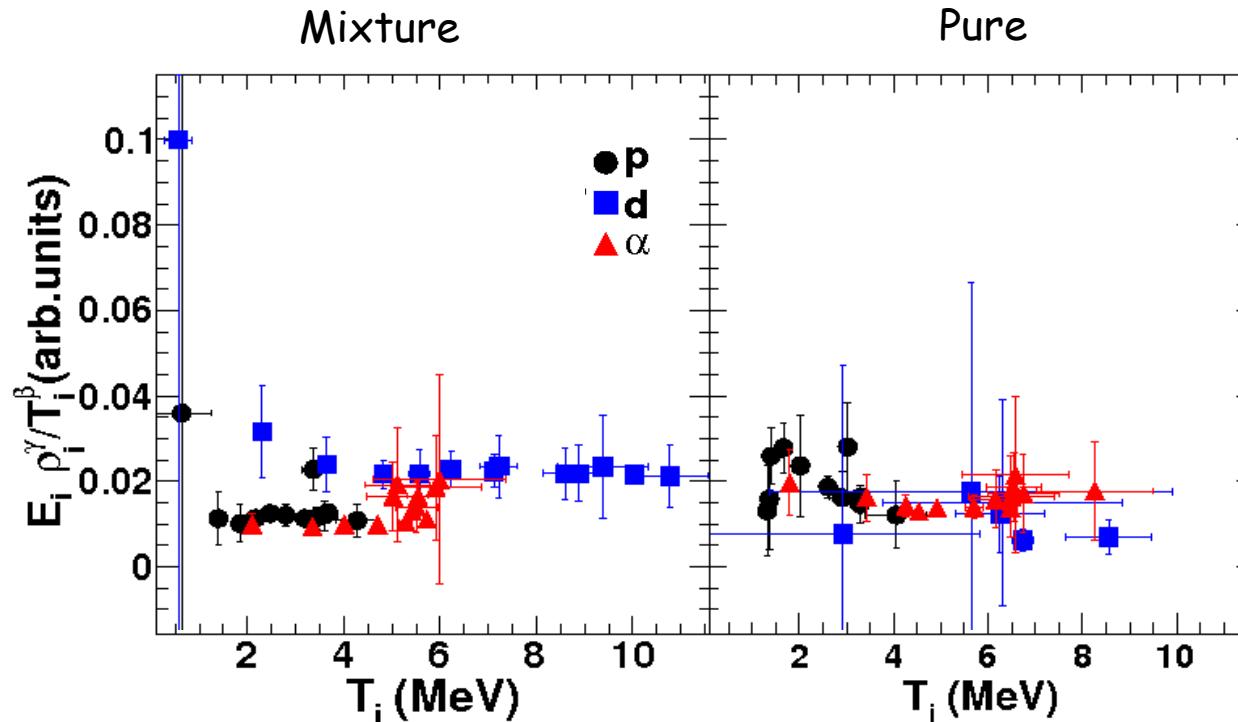

Possible BEC persisting in presence of fermions

# Other signals of BEC : energy per particle

$$E_i = A_i E^*/A_{QP}$$

Ideal Fermi gas :  $E_i \propto T_i^{2/\rho_i^{2/3}}$

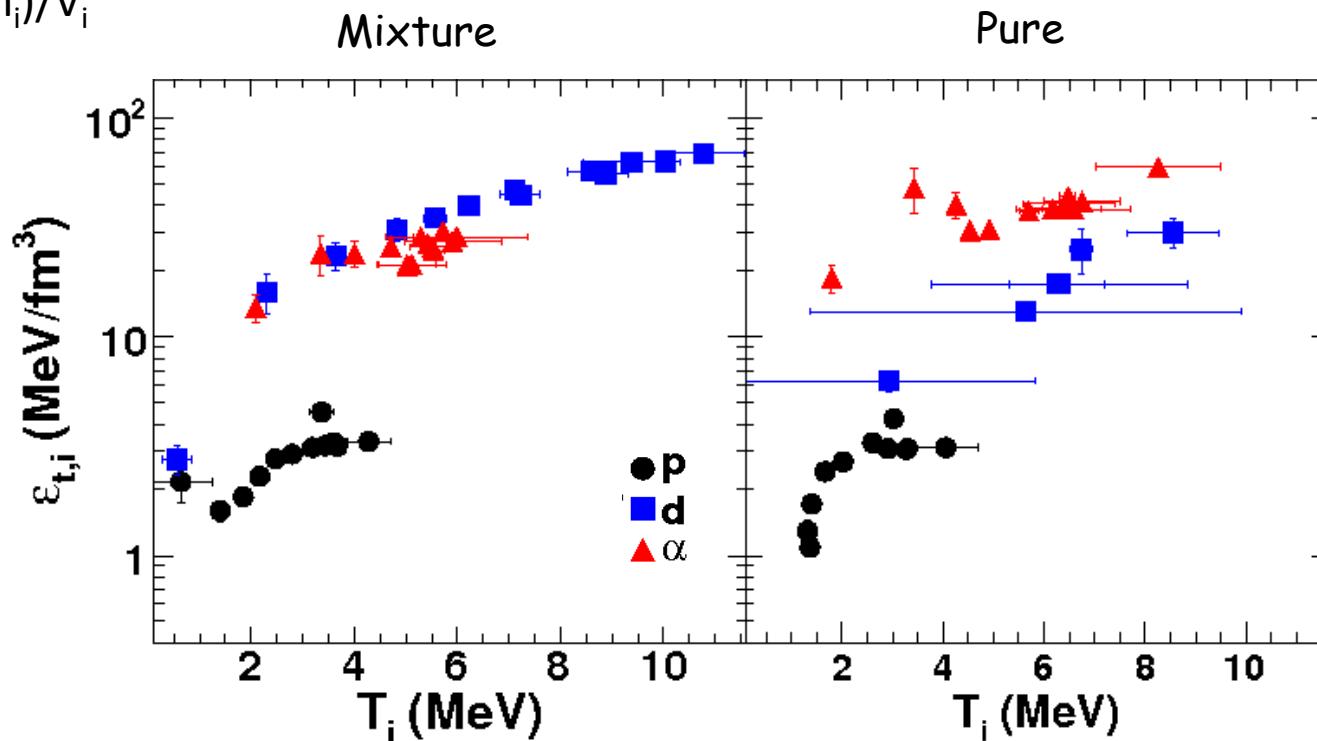

Ideal Bose gas :  $E_i \propto T_i^{5/2/\rho_i}$

Different quantum behavior to the density profile

# Energy density vs T

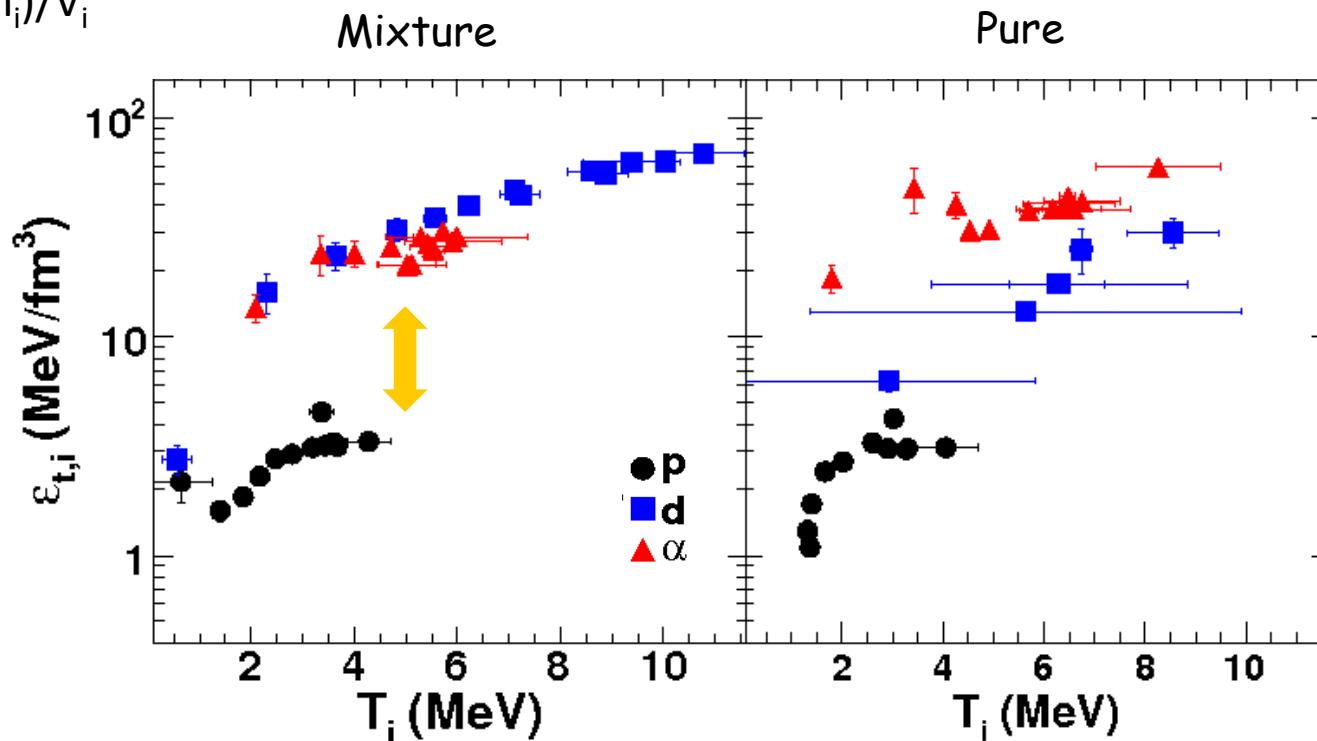

$$\varepsilon_{t,i} = (E^* + m_i)/V_i$$

✓  $\varepsilon_{t,\alpha} = \varepsilon_{t,d}$  for mixture

# Energy density vs T

$$\varepsilon_{t,i} = (E^* + m_i)/V_i$$

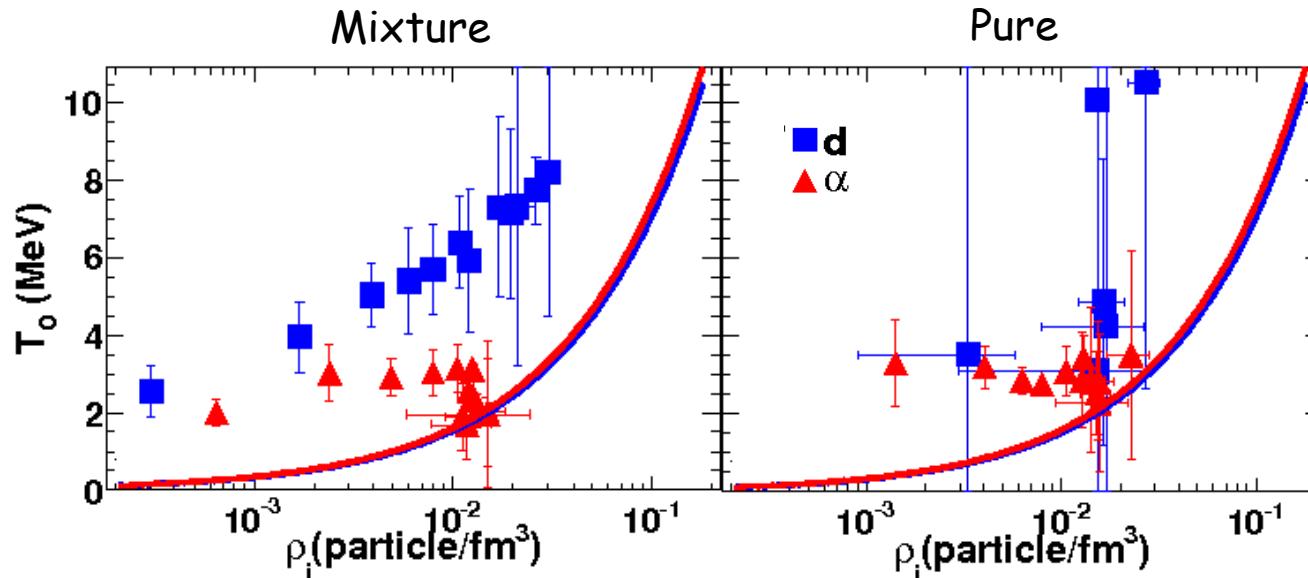

- ✓  $\varepsilon_{t,\alpha} = \varepsilon_{t,d}$  for mixture
- ✓  $\varepsilon_{t,\text{fermions}} < \varepsilon_{t,\text{bosons}}$  up to 7 times

# Condensation temperature

$T_0 = f(E_i)$  for an ideal Bose gas

$$E_i = A_i E^*/A_{QP}$$

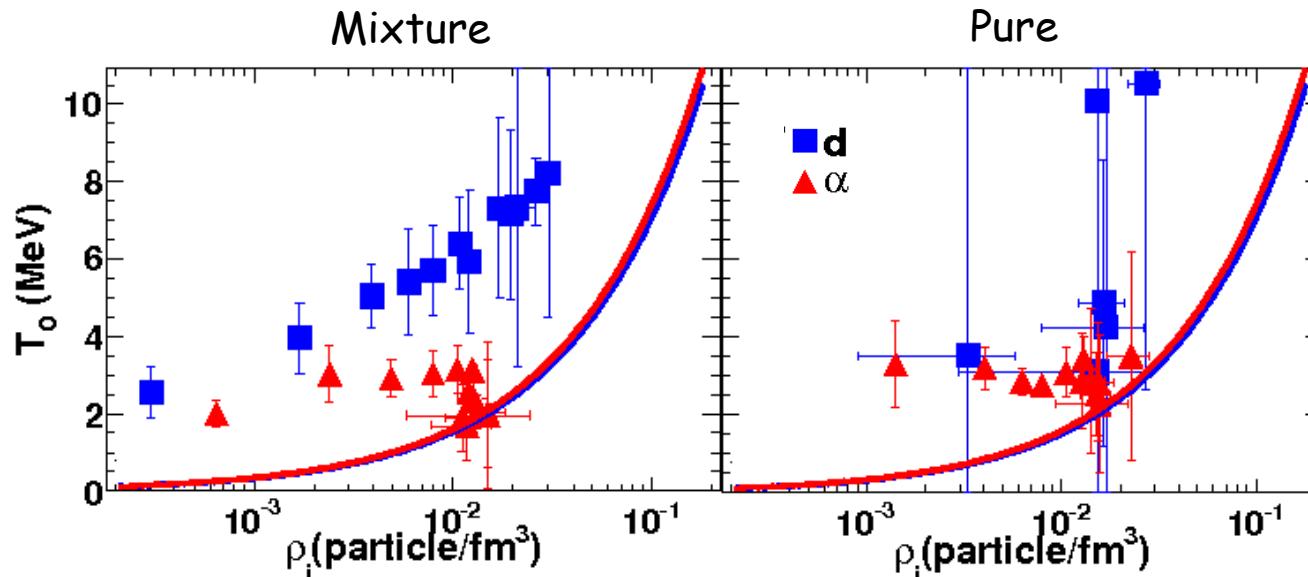

✓  $T_0 \sim$  few MeV as theoretically predicted

H. Zheng et al.; PRC 88 (2013) 024607;  
R. Smith et al., PRL 106 (2011) 250403

# Condensation temperature

$$T_0 = f(E_i) \text{ for an ideal Bose gas}$$

$$E_i = A_i E^*/A_{QP}$$

✓  $T_0 \sim \text{few MeV}$  as theoretically predicted

H. Zheng et al.; PRC 88 (2013) 024607;  
R. Smith et al., PRL 106 (2011) 250403

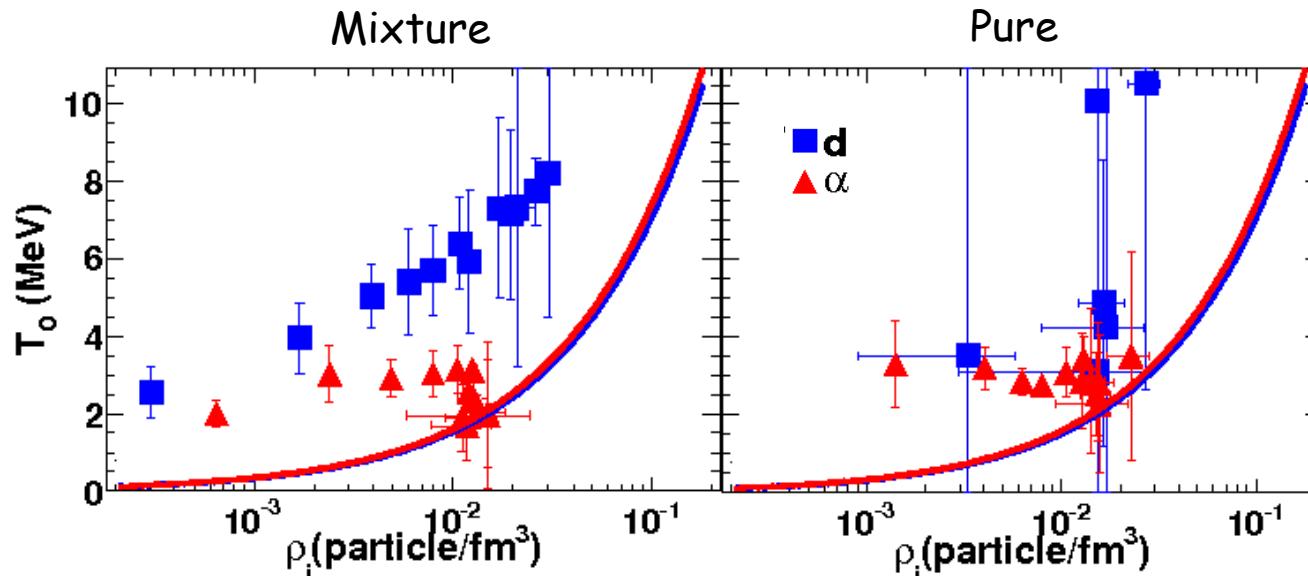

✓  $T_0^{\text{exp}} > T_0^{\text{ideal}}$  due to Coulomb repulsion which enhances the condensation

H. Zheng et al., Nucl. Phys. A; PLB 696 (2011) 178; PRC 86 (2012) 027602; PRC 88 (2013) 024607  
R. Smith et al., PRL 106 (2011) 250403  
K. Huang, Statistical Mechanics p286

# Condensation temperature

$$T_0 = f(E_i) \text{ for an ideal Bose gas}$$

$$E_i = A_i E^*/A_{QP}$$

- ✓  $T_0 \sim \text{few MeV}$  as theoretically predicted
  - ✓  $T_0^{\text{exp}} > T_0^{\text{ideal}}$  due to Coulomb repulsion which enhances the condensation
  - ✓ At higher  $\rho$  :  $T_0 \rightarrow T_0^{\text{ideal}}$  : increased contribution of nuclear force counterbalancing Coulomb repulsion  
...as  $\rho$  increases the attractive nuclear force becomes dominant, bosons overlap and dissolve in their constituent and the Pauli blocking becomes dominant
- H. Zheng et al.; PRC 88 (2013) 024607;  
R. Smith et al., PRL 106 (2011) 250403
- H. Zheng et al., Nucl. Phys. A; PLB 696 (2011) 178; PRC 86 (2012) 027602; PRC 88 (2013) 024607
- R. Smith et al., PRL 106 (2011) 250403
- K. Huang, Statistical Mechanics (1963)

# Conclusions ...

Decay of excited QP systems produced in  $^{40}\text{Ca} + ^{40}\text{Ca}$  at 35 MeV/A

- Detection system → reconstruction of  $A_{\text{QP}}$ ,  $Z_{\text{QP}}$ ,  $E^*_{\text{QP}}$  event by event

Technique : quantum fluctuation method

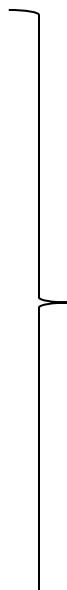

Results :

$$\rho_{\text{fermions}} < \rho_{\text{bosons}}$$

$$\varepsilon_{t, \text{fermions}} < \varepsilon_{t, \text{bosons}}$$

$$T_0 \sim \text{few MeV}$$

The observed **signals** are **present** also in events where **mixture** of bosons and fermions are present (as observed in atomic traps)

Reduction of fermionic component where the bosonic one is present

Not reduced by boson-fermion interaction

Interpretation

Signals of Bose-Einstein condensation

Similar nature for processes occurring in quantum systems at the atomic and nuclear scales

What are the implications of these phenomena on  $\alpha$  clustering and symmetry energy at low  $p$ ?

Do these phenomena persist in lighter/heavier N=Z systems?

(candidate :  $^{56-58}\text{Ni}+^{58}\text{Ni}$ )

Do these phenomena persist in N>Z systems?

( $^{48}\text{Ca}+^{48}\text{Ca}$ ...how to deal with non-detected neutrons)

**Technique** : particle-particle correlations for emission  $\rho$  estimation

## A special thank to...

A. Bonasera, A. Chbihi, P. Napolitani, G. Verde, H. Zheng

the INDRA-VAMOS Collaboration

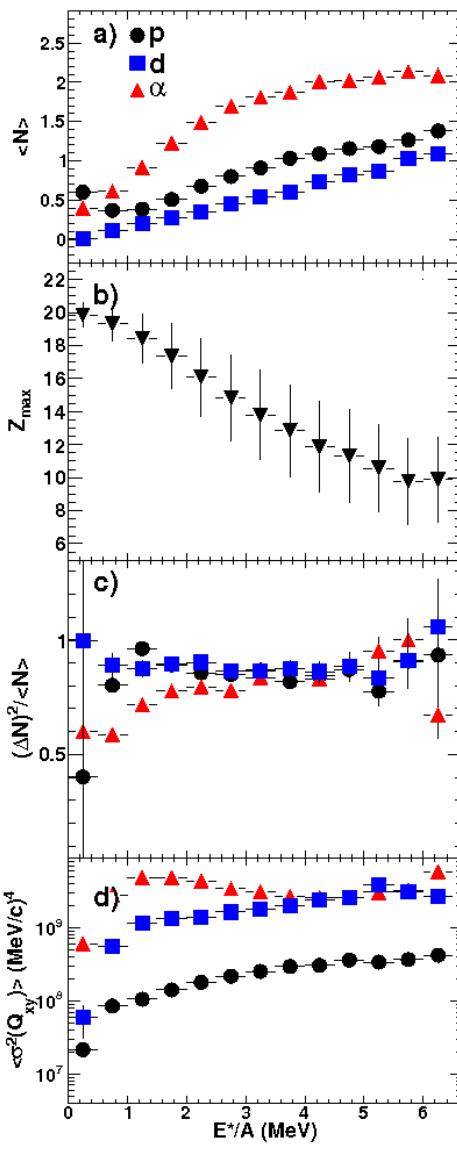

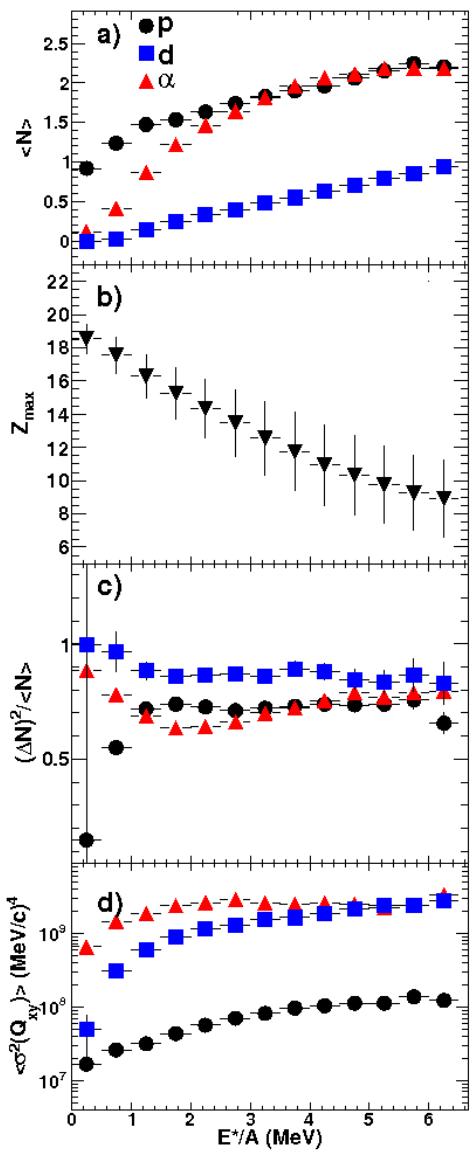

the ACEN group of CENBG

## Thank you for your attention

This work was supported by the CEA, CNRS, the Ministère de l'Education Nationale and Conseil Régional de Basse Normandie

# $^{40}\text{Ca} + ^{40}\text{Ca}$ vs $^{48}\text{Ca} + ^{48}\text{Ca}$

# Event reconstruction and selection

## QP reconstruction :

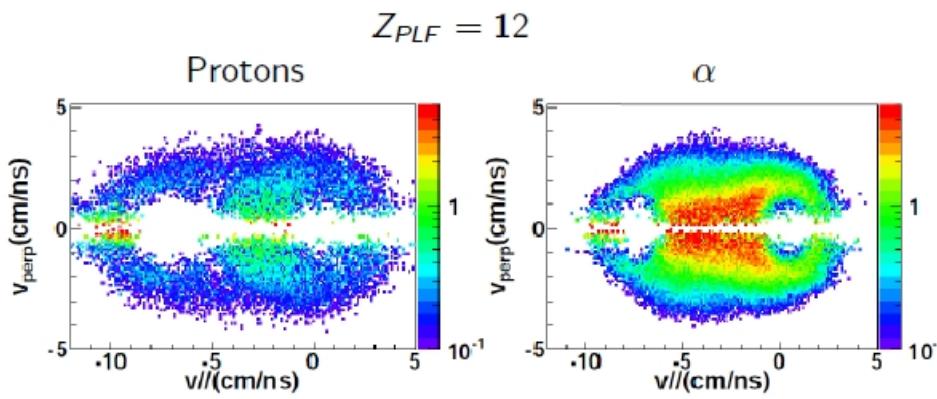

PLF + CP belonging to QP

(based on  $v/v_{PLF}$  criteria)

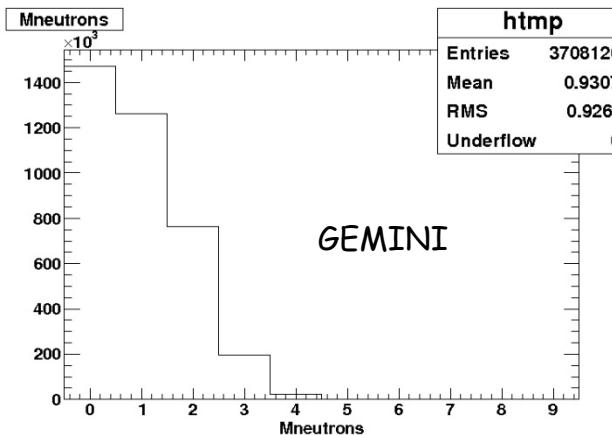

J. Steckmeyer et al., Nucl. Phys. A 686 (2001) 537

$Z_{QP}, A_{QP}, E_{QP}^*$

(from calorimetry)

## Event selection : $^{34-46}\text{Ca}$ QP events

Non-detected neutrons :

$$\langle M_n \rangle < 1 \text{ for all } E_{QP}^*$$

$\alpha$  and p emissions are energetically favoured for  $^{34-44}\text{Ca}$

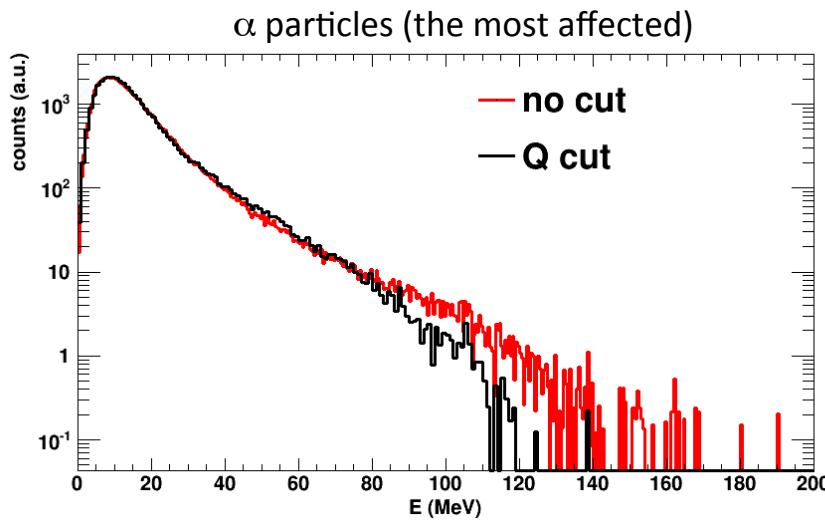

## Event selection : isotropic emission events

to have a certain degree of equilibration

$$Q_{\text{shape}} = \frac{\sum (p_z^i)^2}{\sum (p_{\text{perp}}^i)^2}$$

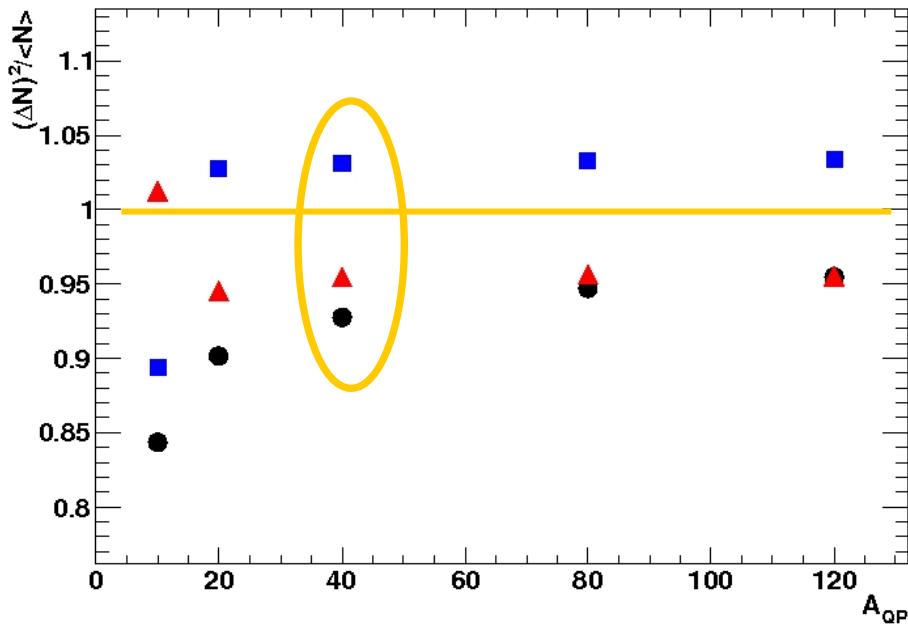

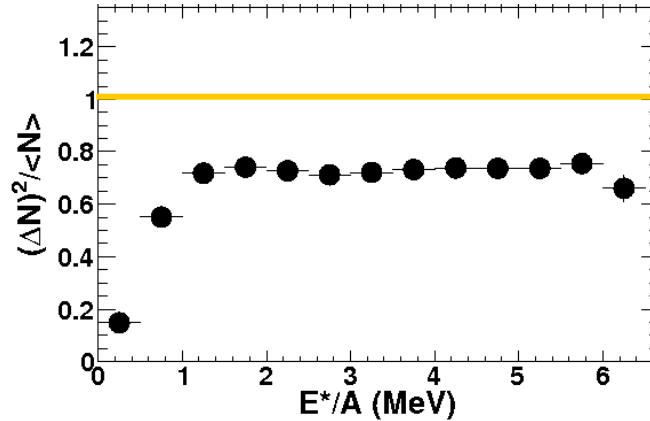

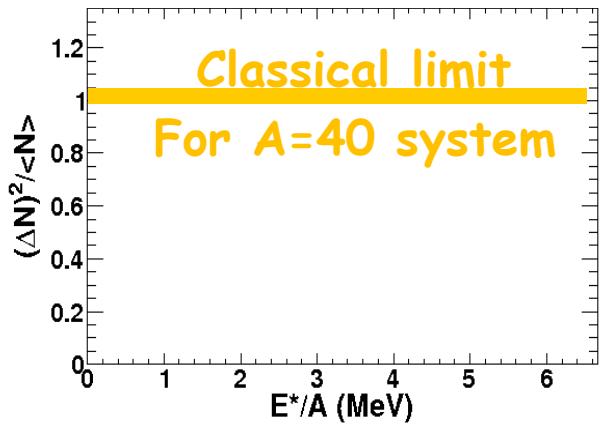

$$-0.3 < \log Q_{\text{shape}} < 0.3$$

The influence of these selections was monitored all along the analysis

# Particle multiplicity fluctuations

Fermions

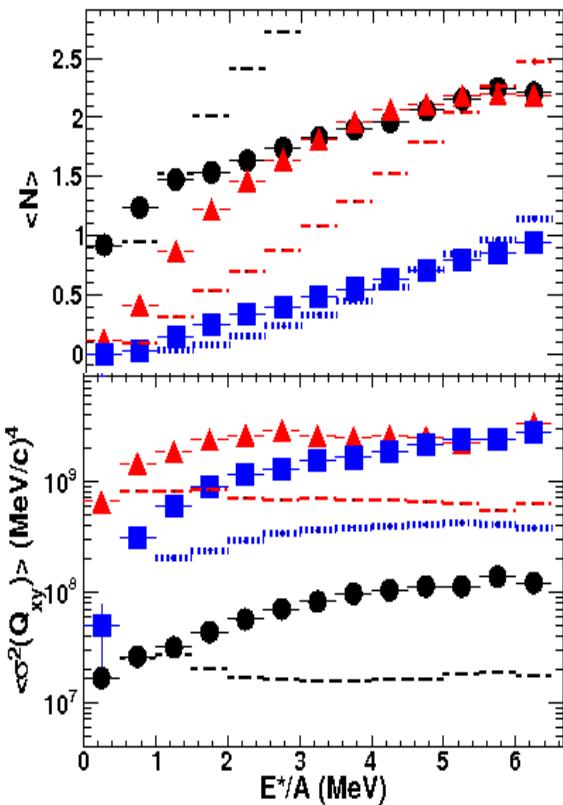

Simple MonteCarlo  
assuming a flat emission  
probability for particles up  
to  $Z=5$

GEMINI : typically reproduces observables from statistical decay at similar  $E^*$

R. Charity, PRC 82 (2010) 014610 and refs therein

## Multiplicity & quadrupole momentum fluctuations :

● p  
■ d  
▲  $\alpha$

GEMINI reproduces  
the ordering :

- reaction Q-value
- decaying nucleus  $E^*$

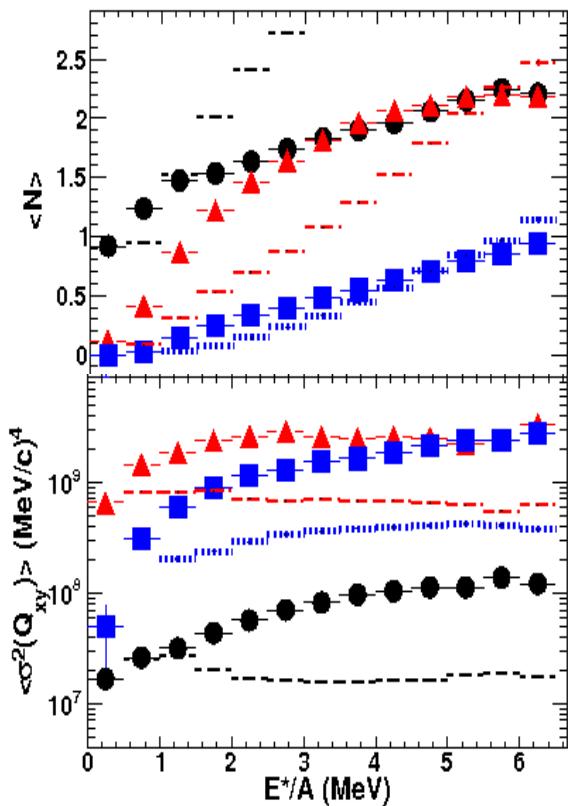

properly described in  
the model

# Comparison to statistical emission

GEMINI : typically reproduces observables from statistical decay at similar  $E^*$

R. Charity, PRC 82 (2010) 014610 and refs therein

## Multiplicity & quadrupole momentum fluctuations :

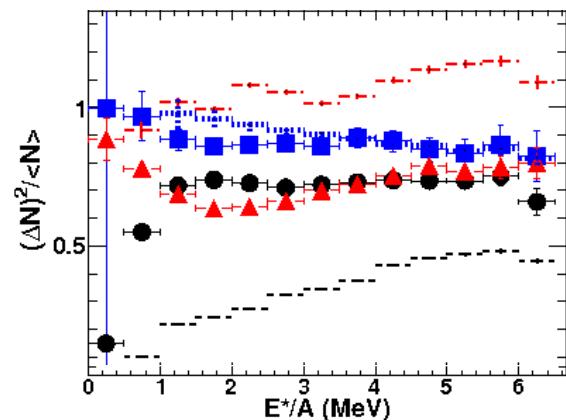

● p  
■ d  
▲ α

GEMINI reproduces the ordering :

- reaction Q-value
- decaying nucleus  $E^*$

properly described in the model

## Multiplicity fluctuations :

NOT reproduced :

quantum nature of particles neglected in the model

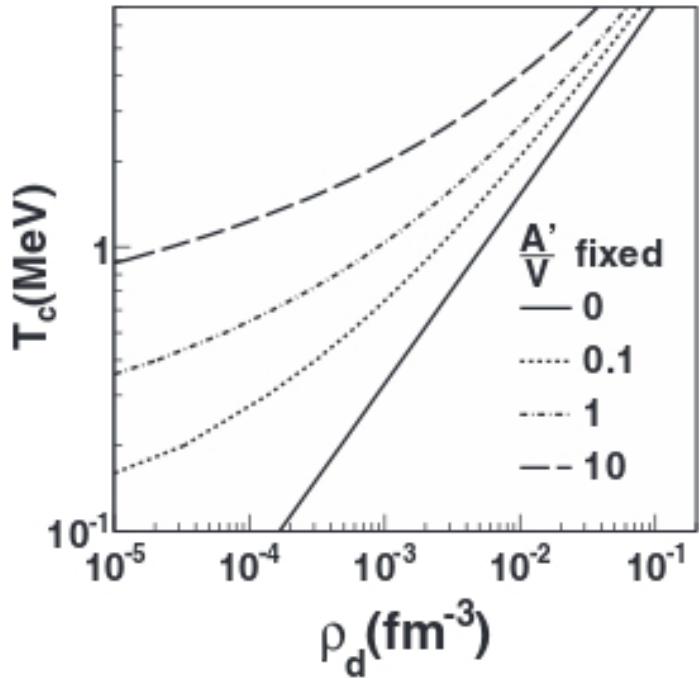

Not compatible with a standard statistical emission

Models accounting for bosonic nature of  $\alpha$  and  $d$  are under development

S. Typel et al., PRC 81 (2010) 015803, and 89 (2014) 064321

# Coulomb effect on condensation T

H. Zheng et al.; PRC 88 (2013) 024607;

The Coulomb interaction increases the condensation temperature

FIG. 2. Critical temperature versus density with fixed  $\frac{A'}{V}$ . We take  $d$  as an example.
